SKILLS

Network security
DNS, Zeek, Wireshark and TShark, Pi-hole, Kali Linux, traffic analysis

Machine Learning and LLMs
CatBoost, Random Forest, MLP, Ollama, feature engineering

Development
Python, C++, C#/.NET, Java, JavaScript, HTML and CSS, PHP

Systems and data
Linux, Docker Compose, MongoDB, MySQL, SQLite

LANGUAGES

Italian · native

English · B2 (certified)

RICCARDO NASATTI

Cybersecurity · Network Security · Software Development

Computer Science and Engineering MSc student at Politecnico di Milano, specializing in Cybersecurity, with a BSc in Computer Engineering from the University of Bergamo. My background combines full-stack software development (desktop and web applications) with a growing focus on network security and threat detection. Open to internships, thesis collaborations and international opportunities.

EDUCATION

MSc in Computer Science and Engineering · 2026 – present
Politecnico di Milano · Cybersecurity focus through elective courses

BSc in Computer Engineering · 2023 – 2026
University of Bergamo · 100/110
Relevant courses: C++ programming, object-oriented programming (Java), operating systems, databases, computer architecture, networks and telecommunications.

High school diploma, IT and Telecommunications · 2018 – 2023
I.T.I.S. P. Paleocapa · 96/100

PROJECTS

DNS threat detection system using heuristics, Machine Learning and LLMs
Bachelor's thesis · Code and thesis: github.com/Nasatti/DNS-IDS-ML-LLM

- Designed and built from scratch an isolated two-node lab: an attacker (Kali Linux) generating benign traffic (4.5M real domains, DNS-OARC) and three attack classes (DNS tunneling, DGA, typosquatting and Punycode); a defender (Ubuntu Server) running Docker Compose, Pi-hole, Zeek, TShark and MongoDB.
- Developed a real-time Python pipeline that streams Zeek logs and extracts lexical and statistical features (Shannon entropy, length, contiguous consonants, QType).
- Compared three approaches on 20,000+ unique queries: heuristic rules, supervised ML (CatBoost: 96.13% accuracy and F1, sub-millisecond inference) and a local LLM (gpt-oss:120b via Ollama) that explains each verdict.
- Proposed a two-tier hybrid architecture: ML for real-time filtering, with an asynchronous LLM validating and explaining ambiguous cases.

PizzApp – Desktop management system · university project, 2025 – 2026

- Co-developed a full-stack desktop application in Java and SQLite to automate order and delivery workflows, using the Kanban agile methodology.

EXPERIENCE

Part-time delivery driver · Ponypizza · 2023 – present

- Part-time work alongside full-time university studies.

Intern · DDX srl · June – July 2022

- Developed a Python plug-in for tool cleaning, built on the proprietary libraries of EasyWood, the company's CAD/CAM software for woodworking.
